- (2) Best scenario: It is the difference between the target value and the aggregate market price of the portfolio. To calculate the target value, we apply a multiple to the normalized cash flow based on our estimate of each company.
- (3) Worst scenario: Calculated with the VALUE AT RISK Methodology (VaR) 2.32 sigmas, 99% confidence level of the normal distribution at 1 month
- (4) It is calculated by dividing the market capitalization of each company by its normalized cash flow based on our estimates.
- (5) It is the result of dividing the normalized cash flow based on our estimates, by the Enterprise Value.
- (6) We calculate it by dividing the normalized operating result based on our own estimates, after taxes, by the capital employed (ex goodwill) in order to get the business profitability.
