(1) Past returns do not guarantee future returns. Past performance is not a guide to future performance. The performance data does not take into account of the commissions and costs incurred on the issue and redemption of units. The value of investments and any income is not guaranteed and can go down as well as up and may be affected by exchange rate fluctuations. This means that an investor may not get back the amount invested. Index returns assume reinvestment of dividends and capital gains unlike fund returns do not reflect fees or expenses.

(2) Best scenario: It is the difference between the target value and the aggregate market price of the portfolio. To calculate the target value, we apply a multiple to the normalized cash flow based on our estimate of each company.

(3) Worst scenario: Calculated with the VALUE AT RISK Methodology (VaR) 2.32 sigmas, 99% confidence level of the normal distribution at 1 month.

(4) It is calculated by dividing the market capitalization of each company by its normalized cash flow based on our estimates.

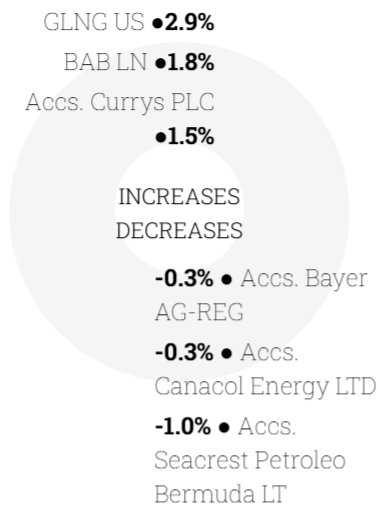

(5) It is the result of dividing the normalized cash flow based on our estimates, by the Enterprise Value.

(6) We calculate it by dividing the normalized operating result based on our own estimates, after taxes, by the capital employed (ex – goodwill) in order to get the business profitability.
